Abstract: Using Jiang function we are able to prove almost all prime problems in prime distribution.This is the Book proof. In this paper using Jiang function $J_{2}(\omega)$ we prove that the new prime theorems (441)- (490) contain infinitely many prime solutions and no prime solutions.From(6) we are able to find the smallest solution $\pi_{k}\left(N_{0}, 2\right) \geq 1$. This is the Book theorem.

Analytic and combinatorial number theory (August 29-September 3, ICM2010) is a conjecture. The sieve methods and circle method are outdated methods which cannot prove twin prime conjecture and Goldbach's conjecture. The papers of Goldston-Pintz-Yildirim and Green-Tao are based on the Hardy-Littlewood prime k-tuple conjecture (1923). But the Hardy-Littlewood prime k-tuple conjecture is false to see

The world mathematicians read Jiang's book and papers.In 1998 Jiang disproved Riemann hypothesis.In 1996 Jiang poved Goldbach conjecture and twin prime conjecture. Using a new analytical tool Jiang invented: the Jiang function, Jiang proves almost all prime problems in prime distribution. Jiang established the foundations of Santilli's isonumber theory. China rejected to speak the Jiang epoch-making works in ICM2002, which was a failure congress.China considers Jiang epoch-making works to be pseudoscience.Jiang negated ICM2006 Fields medal(Green and Tao theorem is false) to see

There are no Jiang's epoch-making works in ICM2010. It cannot represent the modern mathematical level. Therefore ICM2010 is failure congress. China rejects to review Jiang's epoch-making works. IMU is able to review Jiang's epoch-making works.

## The New Prime theorem (441)

$$
P, j P^{802}+k-j(j=1, \cdots, k-1)
$$

Chun-Xuan Jiang

Abstract
Using Jiang function we prove that $j P^{802}+k-j$ contain infinitely many prime solutions and no prime solutions.
Theorem. Let $k$ be a given odd prime.
$P, j P^{802}+k-j(j=1, \cdots, k-1)$.
contain infinitely many prime solutions and no prime solutions.

Proof. We have Jiang function [1,2]
$J_{2}(\omega)=\prod_{P}[P-1-\chi(P)]$
where $\quad \omega=\prod_{P} P, \quad \chi(P)$ is the number of solutions of congruence
$\prod_{j=1}^{k-1}\left[j q^{802}+k-j\right] \equiv 0(\bmod P), q=1, \cdots, P-1$
If $\chi(P) \leq P-2$ then from (2) and (3) we have
$J_{2}(\omega) \neq 0$
We prove that (1) contain infinitely many prime solutions that is for any $k$ there are infinitely many primes $P$ such that each of $j p^{802}+k-j$ is a prime.

If $\chi(P)=P-1$ then from (2) and (3) we have
$J_{2}(\omega)=0$
We prove that (1) contain no prime solutions [1,2]
If $J_{2}(\omega) \neq 0$ then we have asymptotic formula [1,2]
$\pi_{k}(N, 2)=\mid\left\{P \leq N: j P^{802}+k-j=\right.$ prime $\} \left\lvert\, \sim \frac{J_{2}(\omega) \omega^{k-1}}{(802)^{k-1} \phi^{k}(\omega)} \frac{N}{\log ^{k} N}\right.$
where $\phi(\omega)=\prod_{P}(P-1)$.
From (6) we are able to find the smallest solution $\pi_{k}\left(N_{0}, 2\right) \geq 1$
Example 1. Let $k=3$. From (2) and(3) we have
$J_{2}(\omega)=0$
we prove that for $k=3$,
(1) contain no prime solutions. 1 is not a prime.

Example 2. Let $k \neq 3$.
From (2) and (3) we have
$J_{2}(\omega) \neq 0$
We prove that for $k \neq 3$,
(1) contain infinitely many prime solutions

Abstract
Using Jiang function we prove that $j P^{846}+k-j$ contain infinitely many prime solutions and no prime solutions.
Theorem. Let $k$ be a given odd prime.
$P, j P^{846}+k-j(j=1, \cdots, k-1)$.
contain infinitely many prime solutions and no prime solutions.
Proof. We have Jiang function [1,2]
$J_{2}(\omega)=\prod_{P}[P-1-\chi(P)]$
where $\omega=\prod_{P} P, \quad \chi(P)$ is the number of solutions of congruence
$\prod_{j=1}^{k-1}\left[j q^{846}+k-j\right] \equiv 0(\bmod P), q=1, \cdots, P-1$
If $\chi(P) \leq P-2$ then from (2) and (3) we have
$J_{2}(\omega) \neq 0$
We prove that (1) contain infinitely many prime solutions that is for any $k$ there are infinitely many primes $P$ such that each of $j p^{846}+k-j$ is a prime.

If $\chi(P)=P-1$ then from (2) and (3) we have
$J_{2}(\omega)=0$
We prove that (1) contain no prime solutions [1,2]
If $J_{2}(\omega) \neq 0$ then we have asymptotic formula [1,2]
$\pi_{k}(N, 2)=\mid\left\{P \leq N: j P^{846}+k-j=\right.$ prime $\} \left\lvert\, \sim \frac{J_{2}(\omega) \omega^{k-1}}{(846)^{k-1} \phi^{k}(\omega)} \frac{N}{\log ^{k} N}\right.$
where $\phi(\omega)=\prod_{P}(P-1)$.
Example 1. Let $k=3,7,19,283$. From (2) and(3) we have
$J_{2}(\omega)=0$
we prove that for $k=3,7,19,283$,
(1) contain no prime solutions. 1 is not a prime.

Example 2. Let $k \neq 3,7,19,283$.

Theorem. Let $k$ be a given odd prime.
$P, j P^{892}+k-j(j=1, \cdots, k-1)$.
contain infinitely many prime solutions and no prime solutions.
Proof. We have Jiang function [1,2]
$J_{2}(\omega)=\prod_{P}[P-1-\chi(P)]$
where $\omega=\prod_{P} P, \quad \chi(P)$ is the number of solutions of congruence
$\prod_{j=1}^{k-1}\left[j q^{892}+k-j\right] \equiv 0(\bmod P), q=1, \cdots, P-1$
If $\chi(P) \leq P-2$ then from (2) and (3) we have
$J_{2}(\omega) \neq 0$
We prove that (1) contain infinitely many prime solutions that is for any $k$ there are infinitely many primes $P$ such that each of $j p^{892}{ }_{+} k-j$ is a prime.

If $\chi(P)=P-1$ then from (2) and (3) we have
$J_{2}(\omega)=0$
We prove that (1) contain no prime solutions [1,2]
If $J_{2}(\omega) \neq 0$ then we have asymptotic formula [1,2]
$\pi_{k}(N, 2)=\mid\left\{P \leq N: j P^{892}+k-j=\right.$ prime $\} \left\lvert\, \sim \frac{J_{2}(\omega) \omega^{k-1}}{(892)^{k-1} \phi^{k}(\omega)} \frac{N}{\log ^{k} N}\right.$
where $\phi(\omega)=\prod_{P}(P-1)$.
Example 1. Let $k=3,5$. From (2) and(3) we have

$$
\begin{equation*}
J_{2}(\omega)=0 \tag{7}
\end{equation*}
$$

we prove that for $k=3,5$,
(1) contain no prime solutions. 1 is not a prime.

Example 2. Let $k \neq 3,5$.
From (2) and (3) we have
$J_{2}(\omega) \neq 0$
We prove that for $k \neq 3,5$,
(1) contain infinitely many prime solutions

Remark. The prime number theory is basically to count the Jiang function $J_{n+1}(\omega)$ and Jiang prime $k_{\text {-tuple }}$ singular series $\sigma(J)=\frac{J_{2}(\omega) \omega^{k-1}}{\phi^{k}(\omega)}=\prod_{P}\left(1-\frac{1+\chi(P)}{P}\right)\left(1-\frac{1}{P}\right)^{-k}$ [1,2], which can count the number of prime numbers. The prime distribution is not random. But Hardy-Littlewood prime $k$-tuple singular series $\sigma(H)=\prod_{P}\left(1-\frac{v(P)}{P}\right)\left(1-\frac{1}{P}\right)^{-k}$ is false [3-17], which cannot count the number of prime numbers[3].

Szemerédi's theorem does not directly to the primes, because it cannot count the number of primes. Cramér's random model cannot prove any prime problems. The probability of $1 / \log N$ of being prime is false. Assuming that the events " $P$ is prime", " $P+2$ is prime" and " $P+4$ is prime" are independent, we conclude that $P, P+2, P+4$ are simultaneously prime with probability about $1 / \log ^{3} N$. There are about $N / \log ^{3} N$ primes less than $N$. Letting $N \rightarrow \infty$ we obtain the prime conjecture, which is false. The tool of additive prime number theory is basically the Hardy-Littlewood prime tuples conjecture, but cannot prove and count any prime problems[6].

Mathematicians have tried in vain to discover some order in the sequence of prime numbers but we have every reason to believe that there are some mysteries which the human mind will never penetrate.

Leonhard Euler(1707-1783)
It will be another million years, at least, before we understand the primes.

## Paul Erdos(1913-1996)

Of course, the primes are a deterministic set of integers, not a random one, so the predictions given by random models are not rigorous (Terence Tao, Structure and randomness in the prime numbers, preprint). Erdos and Tur án(1936) contributed to probabilistic number theory, where the primes are treated as if they were random, which generates Szemer é di's theorem (1975) and Green-Tao theorem(2004). But they cannot actually prove and count any simplest prime examples: twin primes and Goldbach's conjecture. They don't know what prime theory means, only conjectures.

The Formula of the Particle Radii
In 1996 we found the formula of the particle radii[1-3]

$$
\begin{equation*}
r=1.55[m(G e v)]^{1 / 3} \mathrm{jn} \tag{1}
\end{equation*}
$$

where $1 \mathrm{jn}=10^{-15} \mathrm{~cm}$ and $m(\mathrm{Gev})$ is the mass of the particles.

From (1) we have that the proton and neutron radii are 1.5 jn .

Pohl et al measure the proton diameter $3 \mathrm{jn}[4]$.
We have the formula of the nuclear radii
$r=1.2(A)^{1 / 3} \mathrm{fm}$,
where $1 \mathrm{fm}=10^{-13} \mathrm{~cm}$ and $A$ is its mass number.

It is shows that (1) and (2) have the same form. The particle radii $r<5 \mathrm{jn}$ and the nuclear radii $r<7 \mathrm{fm}$.
